

Push to Talk and Push to Mute Handsets

Algo's Push-to-Talk (PTT) and Push-to-Mute (PTM) handsets are a high-quality, fully-compatible handset replacement solution for Nortel digital, IP, and Meridian Digital Centrex telephones.

Built from original Nortel handsets, Algo PTT/PTM handsets provide a reliable and easy-to-use solution for applications where it is important to prevent background noise and conversations from being heard at the far end of a telephone call (in between speaking).

Algo PTT handsets operate by allowing normal transmission of voice and background sounds to a remote party **ONLY** when the Talk button is pressed. When the button is released (Normal mode), the handset microphone is disabled, securely muting the transmission of speech and background sounds while still allowing the remote party to be heard. PTT handsets are ideal for such applications as conference calls, financial trading, and military applications.

Algo PTM handsets work in just the opposite way as PTT - by disabling the handset microphone when the button is pressed and restoring normal operation when the button is released.

PTM handsets are suited for applications where only periodic muting of conversations is required.
