

A thousand faces of access control

The PROXIMITY LCD reader is the new aesthetic reader your clients will love. The reader is fitted with a modern LCD screen which displays one of four images or messages when a token is presented. Not only does this make a great first impression but end-users can customize the screen itself by uploading images of their choice. They can create whatever look they want, whenever they want.

The LCD reader is pre-loaded with four default images. The four images each correspond with a particular reader action. A different image is shown when the reader is idle, when access is granted, when access is denied and when a card and PIN verification is required. We also supply a range of other images within the LCD reader software for other scenarios. These can be changed quickly and easily on a laptop or PC. All you need to do is choose your images and upload them from the laptop or PC. This can be done wirelessly using the Net2Air USB dongle (sold separately).

You can be as imaginative as you like about the images you upload. Your client can upload their logo; you could even include your details here. The reader can be used for advertising space, or to give commands or directions to end users when access is granted or

denied. An attractive image could be used simply to complement its environment.

The new LCD reader also marks the completion of our Architectural Range of readers for installations where style and design are paramount. The range for architecturally-driven projects includes the new LCD reader, the Architectural reader and the Marine reader.

The LCD reader is perfect for use in modern offices, boutique hotels, conference facilities, design studios, public buildings; the possibilities are infinite.

The reader is IPX7 rated, which means it can be used externally. It is compatible with Paxton Access Switch2 and Net2 systems, accepting hands free tokens once a hands free interface has been fitted.

Be the FIRST in the industry to try the LCD reader. Visit us at the ASIS Show in Anaheim. Booth 321.

How the LCD reader could work for your customer...

Idle status
